

- Install python 3.11 ([Windows](#))
- Download AWS workshop resources: <https://shorturl.at/ouG29>
- Extract the workshop zip and enter the folder
- Install python requirements

```
pip install -r setup/requirements.txt
```
- Run `aws configure`
 - Paste the AWS credentials from the email
 - Set default region name to "us-east-1"
 - Leave default output format empty
- Open `completed/api/bedrock_api.py` and make the following changes

```
profile_name="default"
region_name="us-east-1"
endpoint_url → delete the entire row
```
- Try if everything is ok running: `python completed/api/bedrock_api.py`
- If you have some troubles running `aws`, install the awscli ([Windows](#), [Mac](#), [Linux](#))
